## Microinjection of *Bactrocera tryoni* (Queensland fruit fly) embryos

# How to prepare Alt-R<sup>®</sup> CRISPR-Cas9 ribonucleoprotein complexes for microinjection

Contributed by Amanda Choo, University of Adelaide, Adelaide, South Australia

The method presented here is provided by customers who have used the Alt-R CRISPR-Cas9 System. This can serve as a starting point for using the Alt-R CRISPR-Cas9 System in similar biological systems, but may not be fully optimized for your gene or application. IDT does not guarantee these methods, and application specialists at IDT can only provide general guidance with limited troubleshooting and support.

### Materials

| Kits and reagents   | Ordering information   |

## user method

### Methods

#### A. Prepare buffers and enzyme

1. Prepare the Cas9 enzyme working buffer as described in the following table:

| Component           | Amount   | Final concentration |
|---------------------|----------|---------------------|
| 1 M HEPES, pH 7.5   | 200 µL   | 20 mM               |
| 1 M KCl             | 1.5 mL   | 150 mM              |
| Nuclease-Free Water | ~6.5 mL* | —                   |
| Final volume        | 10 mL    |                     |

\* Add 6.5 mL of water, verify pH 7.5, and add more water to reach final volume.

Note: 1X PBS or Opti-MEM media can be used in place of Cas9 enzyme working buffer.

- 2. Before use, thoroughly mix the stock Alt-R S.p. Cas9 enzyme by inverting the tube several times and briefly centrifuge the tube.
- 3. Dilute Alt-R S.p. Cas9 enzyme to a working concentration (for example,  $1 \mu g/\mu L$ ).

**Note:** The molecular weight of the enzyme is 163,700 g/mol. All Alt-R S.p. Cas9 enzymes are provided at a stock concentration of 61  $\mu$ M (10  $\mu$ g/ $\mu$ L).

Example dilution for 1  $\mu$ g/ $\mu$ L:

| Component                               | Amount (µL) |  |  |
|---|-------------|--|--|
| Cas9 dilution buffer ( <b>step A1</b> ) | 9           |  |  |
| Alt-R Cas9 enzyme                       | 1           |  |  |
| Final volume                            | 10          |  |  |

4. Prepare the 10X injection buffer as described in the following table:

| Component                              | Amount             | Final concentration |
|--|--------------------|---------------------|
| 0.1 M Sodium phosphate buffer, pH 6.8* | 0.5 mL             | 1 mM                |
| 1 M KCl                                | 2.5 mL             | 50 mM               |
| Nuclease-Free Water                    | 47 mL              | —                   |
| Final volume                           | 50 mL <sup>†</sup> | —                   |

\* 51 mL of 0.2 M NaH<sub>2</sub>PO<sub>4</sub> + 49 mL of 0.2 M Na<sub>2</sub>HPO<sub>4</sub> + 100 mL of Nuclease-Free Water, then verify pH 6.8.

† Store 1 mL aliquots of the 10X injection buffer at -20°C.

## user method

#### genome editing

#### B. Prepare Alt-R CRISPR-Cas9 guide RNA

- 1. Prepare stock solutions of Alt-R CRISPR-Cas9 crRNAs and tracrRNA.
  - a. Spin down RNA pellet using a microcentrifuge.
  - b. Resuspend each RNA oligo in Nuclease-Free Duplex Buffer to  $100 \ \mu M$  final concentrations as described in the following table:

| Normalized amount delivered (nmol)* | t delivered (nmol)* Volume of resuspension buffer (μL) |  |
|-------------------------------------|--|--|
| 2                                   | 20   |  |
| 5                                   | 50   |  |
| 10                                  | 100  |  |
| 20                                  | 200  |  |
| 100                                 | 1000   |  |

\* Prepare positive and negative controls using the same methods as for the experimental complexes—ideally using the same lots of buffers. Alt-R CRISPR-Cas9 HPRT Positive Control crRNAs and Alt-R CRISPR-Cas9 Negative Control crRNAs are available at 2 nmol scale. Custom Alt-R CRISPR-Cas9 crRNAs are available at 2 and 10 nmol scales. Alt-R CRISPR-Cas9 tracrRNA is available at 5, 20, and 100 nmol scales.

To calculate your own dilutions, use the IDT Resuspension Calculator at www.idtdna.com/SciTools.

- c. Store stock solutions at  $-20^{\circ}$ C, when not in use.
- 2. Mix crRNA and tracrRNA in equimolar concentrations in a sterile microcentrifuge tube to create a final duplex concentration of 40 μM:

| Component  | Amount (µL) | Final concentration |
|--|-------------|---------------------|
| 100 µM Alt-R CRISPR-Cas9 crRNA ( <b>step B1</b> )    | 1           | ~472 ng/µL          |
| 100 µM Alt-R CRISPR-Cas9 tracrRNA ( <b>step B1</b> ) | 1           | ~887 ng/µL          |
| Nuclease-Free Duplex Buffer                          | 0.5         | —                   |
| Final volume   | 2.5         | 40 µM (duplex RNA)  |

- 3. Heat at 95°C for 5 min.
- 4. Remove from heat and allow to cool to room temperature (20–25°C).

## user method

#### C. Assemble ribonucleoprotein (RNP) complex

- 1. Mix the following to assemble RNPs for injection:
  - a. With no donor template for knockout experiments:

| Component   | Amount (µL) | Final concentration |
|---|-------------|---------------------|
| crRNA:tracrRNA duplex (40 µM) ( <b>step B4</b> )            | 2.5         | 10 µM*              |
| Diluted Cas9 enzyme (1 $\mu$ g/ $\mu$ L) ( <b>step A3</b> ) | 3           | 300 ng/µL           |
| 10X Injection buffer ( <b>step A4</b> )                     | 1           | 1X                  |
| Nuclease-Free Water   | 3.5         | _                   |
| Final volume  | 10          | —                   |

b. With donor template for homology-directed repair (HDR) experiments:

| Component   | Amount (µL) | Final concentration |
|---|-------------|---------------------|
| crRNA:tracrRNA duplex (40 µM) ( <b>step B4</b> )            | 2.5         | 10 µM*              |
| Diluted Cas9 enzyme (1 $\mu$ g/ $\mu$ L) ( <b>step A3</b> ) | 3           | 300 ng/µL           |
| ssODN (1 µg/µL)†  | 2           | 200 ng/µL           |
| 10X Injection buffer ( <b>step A4</b> )                     | 1           | 1X                  |
| Nuclease-Free Water   | 1.5         |                     |
| Final volume  | 10          | _                   |

\* The final concentration of the crRNA is ~118 ng/ $\mu L$  and of the tracrRNA is ~222 ng/ $\mu L.$ 

† 4 nmol of Ultramer DNA oligo can be used as the single-stranded deoxyoligonucleotide (ssODN) donor template.

**Note:** 10 µL of injection mix can be used to inject ~300–400 embryos.

2. Incubate at room temperature for 5 min to assemble the RNP complexes.

Note: The injection mix can now be used for embryo microinjections.
